Lab Sheet 2 — Answer / Submission File

Making It Interactive (Vanilla JavaScript)

Student Name	ABHIGYAN DUBEY
Program	B.Tech CSE, 5th Semester
CU ID	CU24250059
Course Code	BTCS303P
Assignment	AS02 — Project Phase 3
Project Theme	OtakuVerse — Anime Merchandise & Webnovel Store
Repository	GitHub: https://github.com/cu24250059-pixel/Full_stack_BTCS303P
Pages Submitted	products.html, cart.html, checkout.html + script.js
Status	Completed — screenshots attached as proof of implementation

This document contains the completed lab sheet requirements along with live screenshots of the working cart logic, dynamic rendering, and checkout form validation as submitted proof.

Requirement Checklist

Part C — JavaScript Interactivity (Phase 3)

✓ script.js created with a product array (id, name, price, image) covering 12+ catalog items

✓ products.html dynamically renders product cards from the array using DOM methods / template literals, replacing hardcoded blocks

✓ 'Add to Cart' click handler on each product card adds the item to a cart array, persisted via localStorage

✓ cart.html reads the cart from localStorage and dynamically renders each item with a working quantity input and Remove button

✓ calculateTotal() recalculates and displays the grand total whenever quantity changes or an item is removed

✓ checkout.html form validation implemented in JavaScript — Name and Address required, Pincode exactly 6 digits, Phone exactly 10 digits, with inline error messages (no alert())

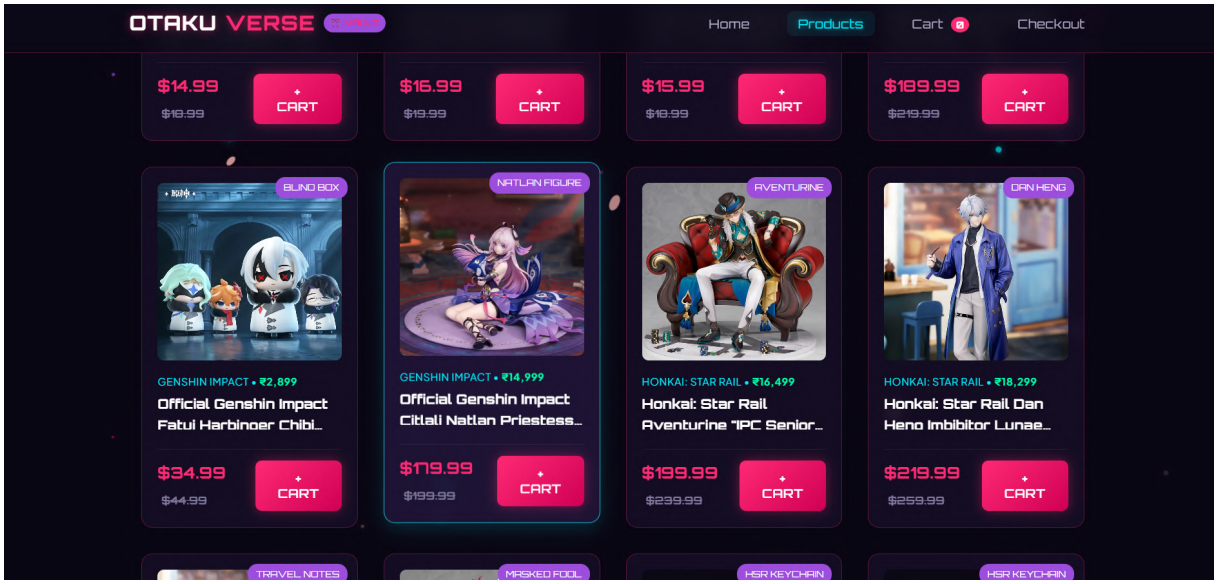

✓ Successful validation shows an on-page confirmation message and clears the cart from localStorage

✓ Cart item count badge next to the Cart link in the navbar, synced from localStorage on every page

Live Output — Screenshots

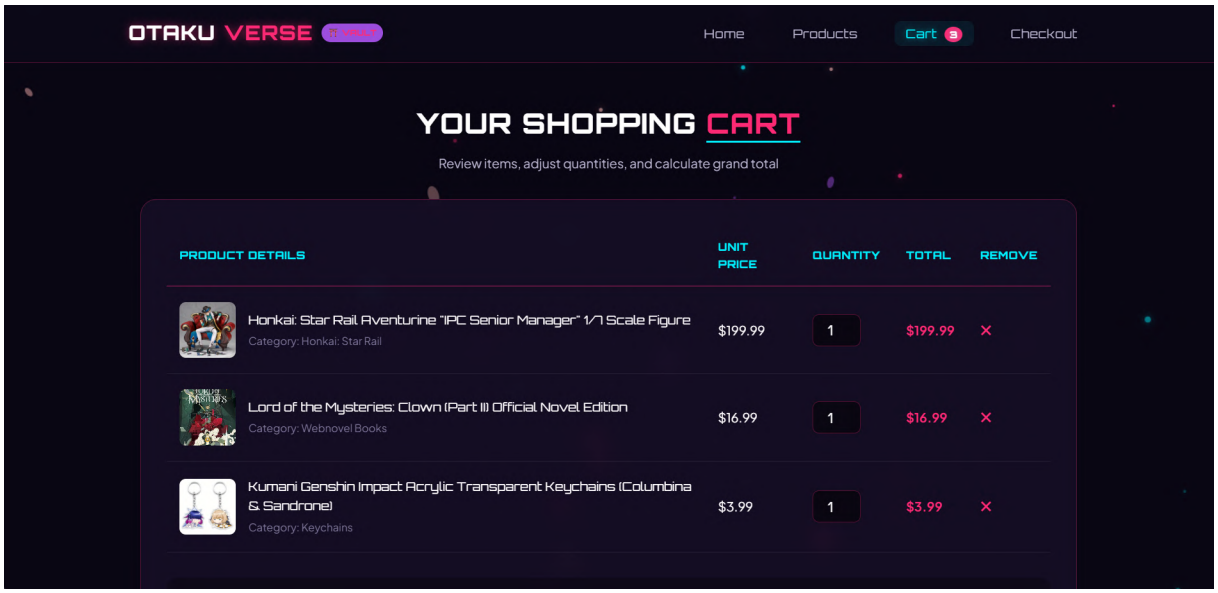

Below are screenshots of the deployed storefront (theme: OtakuVerse) demonstrating the interactive cart logic, dynamic rendering, and checkout validation working end-to-end.

1. Products Page — Dynamic Rendering (products.html)

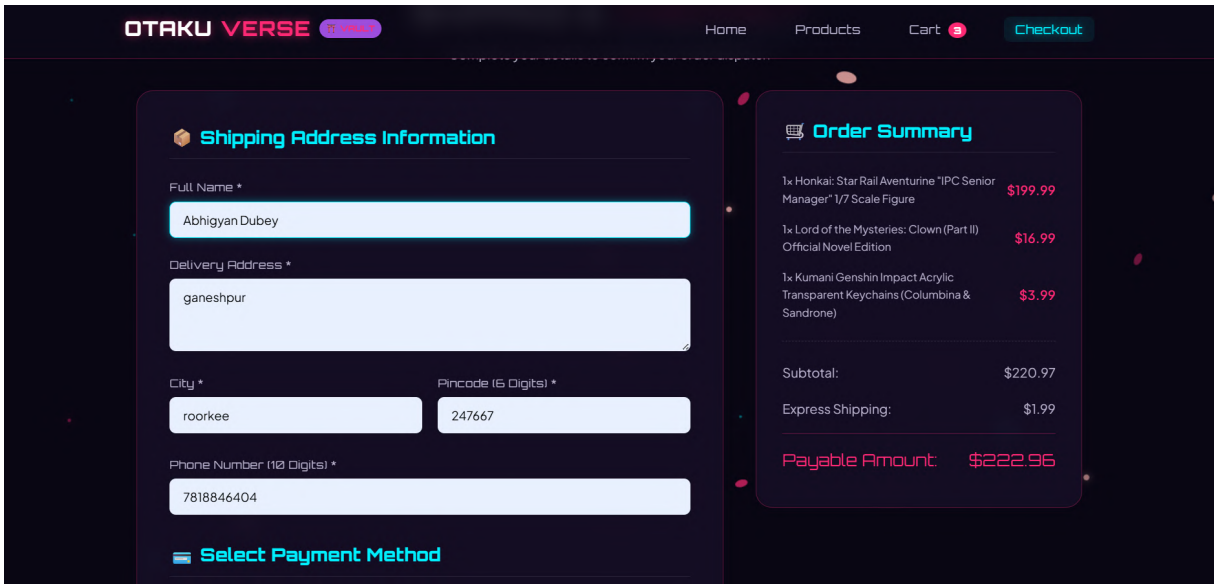

Product cards rendered dynamically from the JavaScript product array, showing category badge, name, price (with strikethrough MRP) and Add to Cart button for each catalog item.

2. Cart Page — localStorage & Quantity Logic (cart.html)

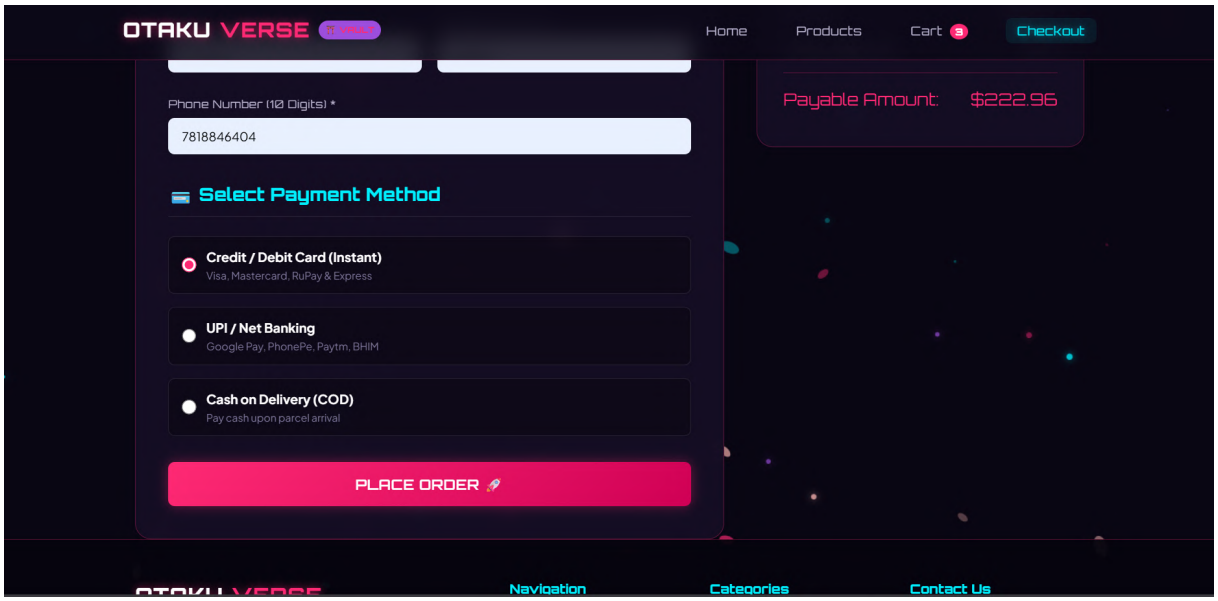

Cart items read from localStorage and rendered dynamically, each with a quantity input and Remove button; the item count badge (3) is reflected next to the Cart link in the navbar.

3. Checkout Page — Shipping Form & Live Order Summary (checkout.html)

Checkout form pre-filled with shipping details, alongside a live Order Summary panel showing subtotal, express shipping and the calculated payable amount, generated via calculateTotal().

4. Checkout Page — Payment Method & Place Order (checkout.html)

Payment method selection and the Place Order button; on successful validation the form triggers the confirmation flow and clears the cart from localStorage.
